Full-Stack Software Engineer | Python, TypeScript/NodeJS, React & Angular | CI/CD & Production Observability

SUMMARY

Full-stack software engineer who builds the internal platforms and service patterns that engineering teams rely on. Professional experience spanning Python and TypeScript/NodeJS backends, React and Angular single-page applications, end-to-end CI/CD (GitHub Actions, Azure DevOps), containerized deployments (Docker), and production observability — logging, telemetry, and application performance monitoring. Motivated by hard, ambiguous problems and by designing reliable systems that remove operational toil and empower cross-functional teams.

EXPERIENCE

Four Hands — Austin, TX Jul 2025 – Present
Software Engineer (Platform & Internal Tooling)

Full-Stack Platform & Service Tooling (NodeJS / React / Python)

- **Architected Enterprise Integration Hub:** Designed and deployed the FH Connect Hub, a scalable internal platform built with NodeJS, Express, and React to unify data flow and service patterns across disparate engineering systems (Jira, Confluence, Mentis).
- **Reusable Service Patterns:** Developed standardized API connectors and data synchronization pipelines in TypeScript and Python, using bounded pagination and automated failure retries to keep platform infrastructure reliable for internal engineering teams.
- **Containerized Environments:** Built multi-environment, Docker-based sandboxes to deploy and orchestrate event-routing workflows, mapping complex data schemas across heterogeneous enterprise platforms.

CI/CD, Testing & System Observability

- **Automated Deployment Pipelines:** Built and managed end-to-end CI/CD workflows using Azure DevOps and GitHub Actions, enabling fast, reliable deployments for platform services and internal applications.
- **Performance Monitoring & Telemetry:** Implemented system telemetry, logging, and error tracking across asynchronous queue workers and event-driven architectures to monitor platform health and resolve production bottlenecks.
- **Automated Validation Infrastructure:** Built an orchestration harness that autonomously runs test validation suites and manages pull request workflows, reducing manual deployment toil and tightening release quality.

ZT Systems (acquired by AMD) — Georgetown, TX Jun 2024 – Sep 2024
System Test Engineer / QA Analyst

- Executed functional validation and performance monitoring on high-density server clusters, using hardware-level telemetry and network diagnostics to track system health.
- Conducted root-cause failure analysis on infrastructure bottlenecks, collaborating with cross-functional engineering teams to implement resolutions and improve overall system reliability.

PROJECTS

Automated Frontend DOM Testing Engine — *TypeScript, NodeJS, React, Playwright*

- Engineered an Electron-based smart recording tool using React and NodeJS that tracks live DOM interactions and autonomously generates scalable, structured validation scripts for engineering teams.

Autonomous Agent Harness (EDDIE) — *Python, API Integrations, Webhooks*

- Developed an event-driven platform service using serverless architecture to parse incoming operational payloads and autonomously trigger downstream infrastructure events and ticketing workflows.

SKILLS

Languages & Frameworks: Python, TypeScript, NodeJS, React.js, Angular, Express.js
Platform & Infrastructure: Docker, Event-Driven Architecture, CI/CD Automation, Reusable Service Patterns
DevOps & Monitoring: Application Performance Monitoring (Telemetry/Observability), Azure DevOps, GitHub Actions, Linux/UNIX (systemd, shell)
API & Integration: REST, GraphQL, Webhooks, Data Pipeline Orchestration

EDUCATION

B.S. Computer Science *(Minor in Mathematics)* — Texas State University Graduated 2025
